

Industry Innovation Councils  
Future Manufacturing  
Gary Zamel

If we think about innovation, we really need to think about a way of thinking.

Mine Site Technologies today is a company of just over a hundred people. We've been in business for near on twenty-five years, and we have developed a series of solutions for mines, such that mines today can be highly connected. We can be in connection with personnel underground, and with vehicles.

It's not just about the senior executives or the management coming up with ideas or being innovative. It's about everybody in the organisation having a culture of innovation and thinking of the way in which to solve problems, address an issue somewhat differently and not use the past as the point of reference.

I think it's very important at a government level that companies, like ours, that are at those early stages, get the support.

We are educating our young people in this country exceptionally well today, and we've got to give them the opportunity to be at the forefront of innovative new businesses for the future.
